Deliverable D1.2

Mid-Term

Impact Assessment

Impact assessment is the final element in the impact value chain. The impact value chain is composed by inputs, activities, outputs, outcomes and impacts. The inputs are used to perform the activities in the project which will generate outputs. From the outputs, outcomes will be derived and impact will be measured. The impact of the project is an important element. It is an indicator of the direction where the consortium partners wish to go with the project. Impact Assessment is an important activity in the project life cycle as it shows that the project is fully aligned with the consortium partners' plans.

The present deliverable D1.2 is a continuation of the deliverable D1.5. It presents the possible impacts arising from the project at three different levels (Personal, Laboratory, Organization). This has been the first step before completing the mapping of the areas of impact in cooperation with the partners and elaborating a questionnaire to be filled in by the partners. The results and conclusions of this work be addressed in the subsequent impact assessment report (D1.3 Long-term impact roadmap).
